

Anthropomorphic Misalignment Research

Challenges

- C1** Anthropomorphic concepts are underspecified
- C2** Anthropomorphic concepts are hard to measure

- C3** Datasets are small in size and lack diversity
- C4** Concept definition issues carry over to dataset design

- C5** Design choices are insufficiently ablated
- C6** Unreliable LLM judges are standard
- C7** Non-target mechanisms remain unmeasured

- C8** Spurious correlations limit causal attribution
- C9** Mechanistic methods overstate functional relevance

S1 Target behavior framing

S2 Data construction & operationalization

S3 Experimental design

S4 Causal & mechanistic attribution

Recommendations

- R1** Scope technical definitions
- R2** Declare evidence levels
- R3** Constrain anthropomorphic terminology

- R4** Support generalization claims with sufficient scale
- R5** Ensure distributional diversity and surface-feature controls

- R6** Measure scorer reliability
- R7** Measure general capability
- R8** Perform sufficient ablations
- R9** Perform tests for alternative expls.

- R10** Generate interventionist evidence
- R11** Formulate mechanistic hypotheses as testable claims
- R12** Match claims to evidence levels
